

Uber

April 19, 2018

Dear Sir/Madam,

I am a junior (3rd year) currently pursuing my Bachelor's degree in Electronics and Electrical Engineering at KIIT University, Bhubaneswar. Being a self-taught Security Researcher and an Android Developer I am a problem-solver who wants to solve the problems that exist in education, security.

It is with great enthusiasm that I would like to apply Software Engineer Intern - Amsterdam 2018 and like to be considered for other open summer internships. Working for Uber has always been a dream of mine since I started my college. As an avid Security Learner and an Android Developer, I understand firsthand the qualities that have allowed you to earn your reputation as the industry leader in the technical field. For the past few years, I've been extremely impressed by the vision of Uber and the products that Uber provides to make its user happy and now I want to contribute and join Uber as an intern. I would be grateful to have a chance to be a part of it.

Recently, I developed a Google Assistant app that can write and read a user's daily journal anytime anywhere and the action will respond according to the user sentiments and emotions. I always love to write automated scripts which make my work easier and help others to make their work faster and easier.

Currently, I am leading a Security team and an Android Developer Team in our college community. Explaining the technical or design issues multiple times does not make me tired because I love what I am doing. It uplifts me to see others realize that they as well should do what they love. We respect each other and our ideas. Of course, we motivate each other to meet the deadlines of the projects we work on. We have brainstorm - and idea-generating sessions. I always try to motivate each of my friends to make progress one step at a time. We have worked on the college systems and network security. We also participate in CTF contests and learn from the failures. Within a week or later, OWASP community will be set up so that the security researchers can learn and teach.

I always love to write automated scripts which make my work easier and help others to make their work faster and easier. This role will give me the opportunity to improve my skills by developing my Software Engineering skills to become a better Software Engineer and an Android Developer. I am an Electronics and Electrical engineering student who is interested in Software development and is confident to try to tackle real-life problems and ready to face the failures and will give his best during the internship period to make the product successful.

Thank you for your consideration.

Sincerely,
Samsruti Dash
