I am a sophomore currently pursuing my Bachelor's degree in Electronics and Electrical Engineering at KIIT University, Bhubaneswar and also a self-taught Android Developer and real life problem solver who wanted to solve the small problems from Education, Health-care and Security using technology. I think, Google is something who is solving every possible real life problem that a common person can face and I would be grateful to have a chance to be a part of it and solve those problems.

I am more interested in applying for the Software Engineering Intern, Summer 2017 that was posted on Google Careers website but also like to be considered for other open summer internships.

Recently, I participated in a IBM Hackathon and built a travel assistant chat bot using IBM Watson and Bluemix services like Android SDK, Conversation, Visual Recognition APIs and others. From there I remembered my old project which was based on health care. So I thought to build a chat bot for the patients or for someone where the bot can suggest the medicines according to their symptoms or disease and show them the nearest medicine stores and hospitals.

I always love to write automated scripts which makes my work easier and helped others to make their work faster and easier. While I have worked with the Android apps, this role will give me the opportunity to improve my skills by developing more complex apps and also will help me to become a better Android Developer.

Honestly, I am not a genius like you or others who are already working at Google. But I am Non-Computer Science student who is confident to tackle the real life problem, ready to face the failures and will give his best during the internship period to make the product successful. Please consider me for an interview.

I have attached a copy of my resume that further explains my background and technical skills. I will look forward to hearing from you. Thank you for your consideration.

Sincerely,

Samsruti Dash
